

SECRETED AND TRANSMEMBRANE POLYPEPTIDES AND NUCLEIC ACIDS ENCODING THE SAME

Abstract of Disclosure

The present invention is directed to novel polypeptides and to nucleic acid molecules encoding those polypeptides. Also provided herein are vectors and host cells comprising those nucleic acid sequences, chimeric polypeptide molecules comprising the polypeptides of the present invention fused to heterologous polypeptide sequences, antibodies which bind to the polypeptides of the present invention and to methods for producing the polypeptides of the present invention.

Figures

Figure 1: A line graph showing the relationship between the number of figures and the number of pages. The x-axis represents the number of figures (0 to 100) and the y-axis represents the number of pages (0 to 100). The graph shows a positive correlation, with the number of pages increasing as the number of figures increases. The data points are plotted at intervals of 10 figures, and a smooth curve is drawn through them. The curve starts at (0, 0) and ends at (100, 100). The slope of the curve is steeper at the beginning and becomes flatter as the number of figures increases.
